~~TO: The Arabic Translation Center~~

fax 212-838-7555

The following is to be translated into Arabic and typeset in a typeface known as "Arabic Dib Simplified Bold". Please take care to use all available characters, as the texts are somewhat complex. See attachment. The texts:

④ 1. Counterintelligence is a special form of intelligence activity, separate and distinct from other disciplines. Its purpose is to discover hostile foreign intelligence operations and destroy their effectiveness. This objective involves the protection of the United States Government against infiltration by foreign agents, as well as control and manipulation of adversary intelligence operations. An effort is made to both discern and deceive the plans and intentions of enemy intelligence services.

③ 2. The highest art in tradecraft is to develop a source that you own "lock, stock, and barrel." According to the clandestine ethos, a "controlled" source provides the most reliable intelligence. "Controlled" means, of course, bought or otherwise obligated. Traditionally it has been the aim of the professional in the clandestine service to weave a psychological web around any fruitful contact and tighten that web whenever possible.

Opportunities are limited, but for those in the clandestine service who successfully develop controlled sources, rewards in status and peer respect are high. The modus operandi required, however, is the very antithesis of ethical interpersonal relationships.

② 3. Agencies within the Intelligence Community shall use the least intrusive collection techniques feasible within the United States or directed against United States persons abroad. Agencies are not authorized to use such techniques as electronic surveillance, unconsented physical search, mail surveillance, physical surveillance or monitoring devices unless they are in accordance with procedures established by the head of the agency concerned and approved by the Attorney General. Such procedures shall protect constitutional and other legal rights and limit use of such information to lawful governmental purposes.

Kind Regards,

FIELD GRANITE INTERNATIONAL, LTD.

"Building Blocks For The Future"

April 24, 1990

Dear Field Granite Customers/Clients:

Please be advised that on April 23, 1990, FIELD GRANITE INTERNATIONAL, LTD., sold all its assets to Whetstone Granite Company; c/o Dakota Granite Company, P.O. Box 1351, Milbank, SD, 57252. In the future, please direct your Mahogany and Bellingham granite blocks orders and/or inquiries to Mr. Chuck Monson, Dakota Granite Company (605) 432-5580.

On behalf of Field Granite, we want to thank you for your patronage over these past five years. We sincerely appreciate the opportunity of working with you and getting to know you.

Again, should you have questions in the future, please contact Mr. Chuck Monson of Whetstone Granite Company.

Sincerely,

Gary Litzlsperger

Maintenance Instructions for
The C.I.A. Kryptos Project

Submitted by Jim Sanborn, 1990

This project for the Agency is a site-specific artwork which means that the design would not necessarily be suitable on any other site and that it was designed specifically for this location.

The way that this artwork looks at completion is the way it should look for many years. Maintenance then on this piece, and most importantly on the landscape immediately adjacent to the piece, should be controlled very carefully in order for the work to continue looking as it does today.

1. GENERAL MATERIALS MAINTENANCE

Granite, slate, petrified wood and copper are extremely durable materials. There are however, certain chemicals and practices which have to be avoided adjacent to the artwork in order to extend the already long life of these materials.

1a. Accelerated Chemical Weathering

Rock salt and Calcium Carbonate for ice control may stain and increase the weathering of the copper, granite and petrified wood. Lawn sprays and fertilizer may stain or discolor the materials.

It is very important that the contractors in charge of maintaining the landscape and plaza areas be given copies of these instructions, as well as the individuals who will be responsible for the stewardship and conservation of the artwork at the agency.

1b. Stain or Graffiti removal

Generally the least evasive method should be attempted first. The methods are listed below with number 1 being attempted first and number 5 used as a last resort. All cleaning should be done by a qualified restoration contractor or by a representative of the artist.

1. High pressure water blasting or hand brushing with clean water, only low pressure on the petrified tree.
2. High pressure water blasting or hand brushing with detergent and clean water, only low pressure on the petrified tree.
3. Chemical solvents matched to the materials being removed.
4. High pressure water blasting with mild abrasives.
i.e. walnut shell, corncob, glass beads, low pressure

File Name: AAA_sanbojim_4111603.tif

Copyright:

Usage conditions apply

only on the petrified tree.

5. Mechanical grinding and refinishing, sand blasting.

1c. Copper Patina Restoration

The green color of the copper must be maintained as the original color of the artwork. If the surface has been altered, care must be taken to re-coat the copper with the proper chemicals to promote this green coloration. Please contact the artist, a restoration contractor or a conservator for this information. A mottled green surface is preferred.

1d. Natural Weathering

Due to the nature of the materials and our climate, both the granite and the petrified wood will exfoliate (shed pieces of material from their outside surfaces). This is a natural process and will not affect the structural integrity of the work.

2. POOL MAINTENANCE

The following information should be entrusted to a qualified pool service company. If a contractor is not used then Agency personnel must fully understand these instructions.

2a. The Large Pool

This pool should be considered a natural water feature, with aquatic plants and possibly fish. It should only be drained infrequently for cleaning, taking care not to drain or kill the fish or plant material. This pool should be kept filled to within four inches (4") of the top during the winter to insure overwintering of the fish. The water level will be maintained by the irrigation system during the spring and summer months but must be filled when necessary by using a hose during the fall and winter months.

NOTE:

The surface of this pool must be kept clear of leaves and grass cuttings at all times to insure water clarity.

The bottom should be soft-raked at least twice a year to prevent buildup of organic material which will ultimately, by the generation of methane, poison the pool.

A long-handled net and plastic or wood rake should be kept in the courtyard for this purpose. The Agency landscape contractor should be contacted about this and given these instructions.

This pool is not designed as a wading pool.

2b. The Small Pool

File Name: AAA_sanbojim_4111604.tif

Copyright:

Usage conditions apply

This pool should not be considered a natural feature and as a result, will require considerably more maintenance.

NOTE:

At no time while the pump and lights are energized should the water level drop lower than twelve inches (12") below the plaza paving. Both the pump and the light could be destroyed by this action. Be particularly careful during times of cleaning, that the power to these units is off at the panel.

You will find enclosed here the various documents associated with the mechanical hardware.

NOTE:

The small pool must be kept as clean as possible, daily removal of floating debris (trash and leaves) is essential and could be accomplished by the maintenance staff using the long-handled net in the courtyard.

Monthly draining and cleaning of the pool interior and the filter screen around the motor is recommended. This should be accomplished using a long-handled brush, soft rake and a hose. A hose should be left coiled in the courtyard at all times for the maintenance of both pools. Special attention should be paid to keeping the holes open between the pool and the scupper drain.

In order to maintain water clarity, bromine tablets should be added to the pool at intervals recommended by the manufacturer. This information is shown on the bromine tablet container.

This pool is not intended to be a wading pool.

This pool should not be drained in the winter, but the pump should be turned off during the coldest months. The water level should be kept within ten inches (10") from the top of the pool.

2c. The Pool Coatings

Both pools have been painted with a marine epoxy suitable for swimming pools, and require infrequent recoating. Any major recoating should be accomplished with epoxy compatible materials.

2d. Lighting and Pump Timing

The pump and lights in the small pool are controlled by timers located near the power panel. These units should be set to operate as follows:

1. The pump operates from 8:00 to 20:00 hours daily from

File Name: AAA_sanbojim_4111605.tif

Copyright:

Usage conditions apply

April 1 to December 1.

Refer to the enclosed pump manual for pump maintenance.

2. The light operates from 17:00 to 24:00 hours daily in the fall and winter, and from 20:00 to 24:00 hours daily in the spring and summer.

The light requires a single 500 watt quartz bulb.

3. LANDSCAPE MAINTENANCE

3a. Ornamental grasses

The areas planted with ornamental grasses should be considered "natural" areas and must not be clipped, cut or "controlled" in any way that would alter their natural appearance. The grasses should only be cut down in very late winter to allow for spring growth. The brown grasses then should remain standing throughout the fall and winter. Weed control is important though, so that the grasses remain the dominant plant.

After a period of approximately five years or when the grasses have filled in completely, each plant must be divided with half being planted elsewhere so as to maintain a slight separation of masses so the plants will remain vertical in appearance. Please consult a qualified landscape contractor familiar with ornamental grasses for the completion of this work. The shorter grasses are Pennisetum Alopecuroides and the taller grasses are Miscanthus sinensis "Graziella", purchased from Kurt Bluemell Inc., 2740 Green Lane, Baldwin, MD 21013.

3b. The Existing Lawn Grass

The lawn surrounding the artwork should be maintained right up to the surface of the sculptural elements, taking care though not to injure the materials with power machinery. There should be no mulch placed adjacent to any of the artwork.

3c. The Trees

The red oaks planted in front of the building should be maintained as are the other trees in the area.

The artist's primary address is:

KRYPTOS

A \$250,000 sculpture in the CIA courtyard which contains a cryptographic message. It was created by Jim Sanborn, and dedicated in October of 1990. The ciphertext starts as International Morse code and gets more and more complicated. It is comprised of 2000 characters, and actually contains two codes, one easy and the other hard. Also included in the sculpture is a Vigenere table with the code word KRYPTOS. The key and the plaintext are contained in separate envelopes that DCI has possession of.

Mr. Jim Sanborn
903 Girard Ave., N.E.
Washington, D.C. 20017

Re: Central Intelligence Agency Sculpture

Dear Jim:

The following letter will summarize our meeting at the C.I.A. last week with respect to planting issues around your sculpture.

West Entrance to Building

1. Replace dying yews at the entrance door with shrubs, grasses, and perennials (see sketch #1). Add drainage to these beds per sketch #3A.
2. Renovate soil in the lawn and planting areas per sketch #2 & #3 to improve drainage and growing conditions.
3. Remove or change location of P.J.M. Rhododendrons and other existing trees and shrubs as necessary to accent views of the sculpture.
4. Add clusters of Red Oaks on either side of the entry as per sketch #4.
5. Replace the Pin Oaks on the south side of the entry walk adjacent to the cooling tower building. Change soil, add drainage and install per sketch #5.
6. Add drainage and renovate the soil around the Pin Oaks on the north side of the entry walk adjacent to the parking garage per sketch #6.

Courtyard Area

1. Begin restorative treatment to the grove of existing oak trees which have been damaged during the recent construction of the building and terrace.
 - a. Core aerate the lawn at least twice per year for the next 2 - 3 years.

Studio 915 Creek Drive Annapolis, Maryland 21403

Page 2

- b. Fertilize lawn with lower nitrogen fertilizer (10-10-10) to stimulate root production.
 - c. Begin program to yearly prune out dead wood as it accumulates.
 - d. Begin aggressive gypsy moth eradication program -- remove egg cases where found. Plan on spraying this year.
 - e. Engage a qualified arborist to monitor trees for other diseases which are likely to occur in stressed trees.
- 2. Add a steel angle (1-1/2" high x 2") along pool edge to increase soil depth at concrete lip.
 - 3. Add ornamental grasses and perennials around sculpture. Make soil modifications per sketch #7.
 - 4. In replacement lawn areas, till soil prior to installing lawn.
 - 5. Add ornamental grass and vinca ground cover in planter along west side of courtyard. The soil and drainage in these planters is very poor and vinca may not perform well, unless this fact is changed. (See detail 2 and 3A. Connect drain line to weep holes drilled into seat wall.) If drainage is not changed, plant ivy for the groundcover.

I hope these comments are helpful.

Sincerely,

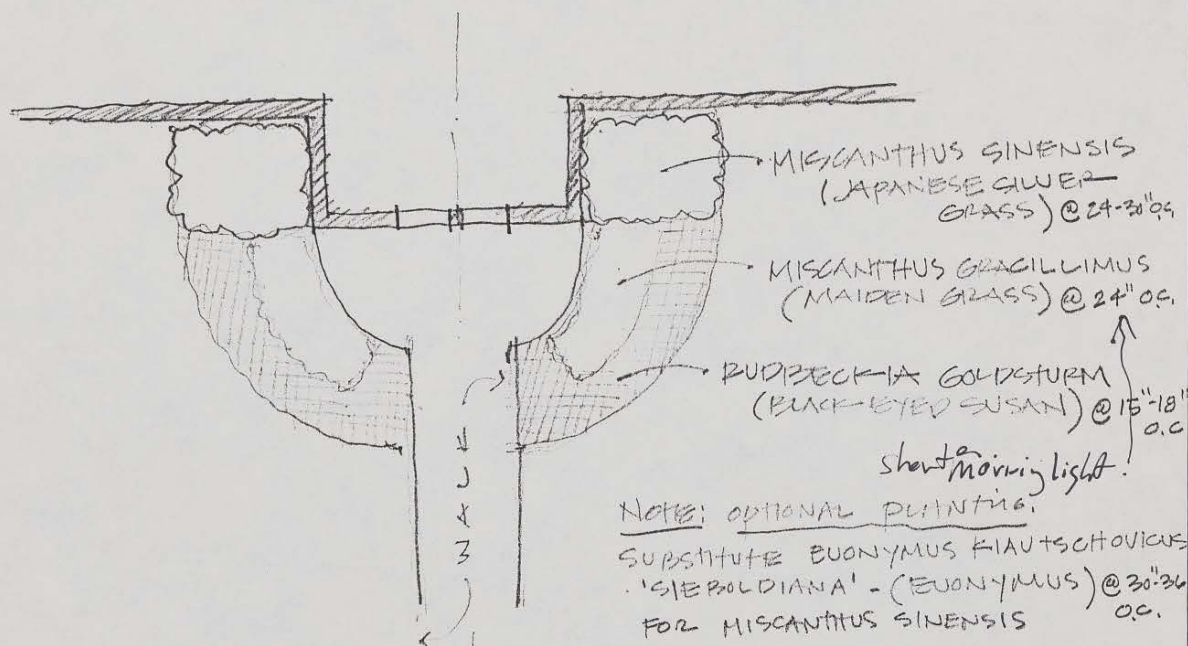

James Urban
